August 1978

PER CAPITA MEAT CONSUMPTION RISES IN 1977

Estimates from 50 reporting countries indicate that per capita consumption of meat increased in most of these countries in 1977. The meats covered by the reports include those derived from livestock and poultry, but exclude fish. In general, these are beef and veal, pork, sheep and goat meat, horsemeat, and poultry (including chicken, turkey, duck, and goose). However, all countries did not report consumption levels for each meat.

Although their consumption was down in 1977, the Australians remain the world's largest meat eaters, consuming nearly 120 kilograms (kg) per capita. About 60 percent of Australia's meat consumption is beef, with sheepmeat, pork and poultry accounting for the rest. Other countries consuming more than 100 kg of meat per capita in 1977 were the United States, Argentina, New Zealand, and Canada.

Argentina continues to be the leading beef consumer on a per capita basis, while West Germany leads in pork. Leading consumers of sheepmeat and poultry are the New Zealanders and Israelis, respectively.

In the United States, 1977's per capita consumption of meat at 112.7 kg was virtually unchanged from that of 1976. A small decline in beef consumption was offset by increases in pork and poultry.

In Japan, where fish is the leading meat, per capita red meat and poultry consumption rose slightly in 1977. Consumption of pork, beef, and poultry moved up to 26.8 kg per person.

In the European Community, declines in per capita meat consumption in several countries in 1977 were offset by increases in others, resulting in a small net gain in the Community average. France and Belgium/Luxembourg continued to be the two leading per capita meat consumers with almost equal levels of consumption, although a slight decline in Belgium/Luxembourg and a small increase in France moved the latter into the No. 1 position in 1977.

The most significant changes in meat consumption within the EC occurred in Ireland and Italy. In Ireland, individual meat intake dropped nearly 3 kg in 1977, the second consecutive year of decline and the largest among EC countries. Nearly all of the decline was in beef and pork, despite the increase in Irish production of both of these meats in 1977. Continued strong demand by other Common Market countries caused a larger share of Ireland's beef and pork production to be exported. Italy's per capita meat consumption rose 2.3 kg, the largest increase within the EC. Beef, pork and poultry consumption each gained.

Significant changes in per capita meat consumption were not confined to the EC. Increases in meat consumption of 3 kg per capita or more were reported for Hungary, New Zealand, Venezuela, the Soviet Union, and Portugal; consumption declined by 3 kg or more in Uruguay and Australia.

Hungary, where per capita consumption of meat has risen significantly in the past 3 years, showed the largest increase of all reporting countries in 1977 as per capita pork consumption mounted nearly 4 kg. Pork accounts for about half of Hungary's meat consumption. Hungary's meat consumption increase in 1977 was largely because of increased availabilities of meat in this nonmarket economy country as production and imports increased and exports decreased.

Per capita consumption of beef, sheepmeat, and pork all registered gains in New Zealand in 1977 as that country's per capita meat consumption returned to 1975 levels. Pork consumption, which only accounts for about 1/8 of meat intake, showed the largest gain as a result of favorable prices from greatly increased domestic production.

The Soviet Union was another country where gains in per capita meat consumption in 1977 reflected a recovery in consumption after a decline in 1976. Per capita Soviet meat consumption hit a record level in 1974 and then increased slightly again in 1975 because of large meat imports and heavier-than-usual

livestock herd liquidations, particulary hogs, that followed the short grain crop that year. Reduced hog numbers and reduced meat imports lowered total meat supplies in 1976.

Approximately 1/3 of Soviet meat consumption is pork. With production and imports of pork, beef, and poultry increasing in 1977, per capita meat consumption moved up but was still below the levels attained in 1974 and 1975.

Venezuela continued its upward trend in per capita meat consumption in 1977 as mounting income levels in this oil-rich nation resulted in strong consumer demand for meats despite rising prices. Most of the meat consumption gain was in beef, which makes up 60 percent of Venezuelan meat consumption. Beef production and imports increased significantly in 1977.

Portuguese consumption of meat rose by more than 3 kg per capita in 1977. Nearly all of this gain was caused by increased poultry consumption, which accounts for about a third of Portugal's meat consumption. Favorable prices of poultry (vis-a-vis beef and pork) upped its consumption as poultry meat production increased nearly 25 percent in 1977 over year-earlier levels.

Heading countries where per capita meat consumption declined was Uruguay, where per capita consumption dropped more than 20 kg. Although sheepmeat comprises only a small part of Uruguay's meat intake, per capita consumption fell by more than 12 kg in the wake of greatly lower sheepmeat production. Sheep producers retained more animals for wool production in 1977 because of favorable wool prices. The remainder of the decline was in beef, which accounts for most of Uruguay's meat consumption. Government-controlled cattle prices were kept at such low levels that farmers withheld their cattle from market, resulting in scarcity and even unavailability of beef in some areas.

Per capita meat consumption was down in Australia in 1977. Slight increases in pork and poultry consumption could not make up for the declines in sheepmeat and beef. Individual consumption of sheepmeat showed the largest reduction as domestic availabilities fell because of a reduced slaughter in 1977 and increased sheepmeat exports. Flock numbers have been declining since 1975, because of drought, poor lambing rates and increasing exports of live sheep. Increased Australian beef exports lowered domestic beef supplies despite higher production from the drought-induced, record cattle slaughter in 1977.
